

Ac4GlcNAz (N-Azidoacetylglucosamine-tetraacylated)

<http://cn.lumiprobe.com/p/tetraacetyl-n-azidoacetylglucosamine-ac4glcnaz>

The tetraacetylated N-Azidoacetyl-glucosamine (Ac4GlcNAz) is an azide-labeled monosaccharide that provides a highly specific tool for studying glycoproteins through metabolic labeling *in vivo* and subsequent chemoselective ligation.

Ac4GlcNAz is cell-permeable unnatural sugar that is intracellularly processed and incorporated instead of its natural monosaccharide counterpart N-Acetylglucosamine (GlcNAc).

The resulting azide-contained glycoprotein can be detected via [Cu\(I\)-catalyzed \(CuAAC\)](#) or [copper-free \(SPAAC\)](#) click reaction with either fluorescent-labeled [alkynes/cycloalkynes](#) or [biotin-alkyne](#).

The recommended concentration for cell labeling is 25-75 μM , and this concentration range may be a starting point for an individual experiment setup.
