# Ac4ManNAz (N-Azidoacetylmannosamine-tetraacylated)

http://cn.lumiprobe.com/p/tetraacetyl-n-azidoacetylmannosamine-ac4mannaz

The tetraacetylated N-Azidoacetyl-mannosamine (Ac4ManNAz) is an azide-labeled monosaccharide that provides a highly specific tool for studying glycoproteins through metabolic labeling *in vivo* and subsequent chemoselective ligation.

Ac4ManNAz is cell-permeable unnatural sugar that is intracellularly processed and incorporated instead of its natural monosaccharide counterpart N-Acetylmannosamine (ManNAc).

The resulting azide-contained glycoprotein can be detected via Cu(I)-catalyzed (CuAAC) or copper-free (SPAAC) click reaction with either fluorescent-labeled alkynes/cycloalkynes or biotin-alkyne.

The recommended concentration for cell labeling is 25-75 µM, and this concentration range may be a starting point for an individual experiment setup.
